## 0.1 Plain text

Here is some plain text.

Now we add a citation: a Langtangen book [?]. And a paper [?].

# 0.2 Explanation

Let's explain some of this code (setting the code to be unexecutable): The for loop:

```
for number in range(10):
total = total + (number + 1)
```

Goes through numbers 0 to 9 and adds 1 more than each number to the  $\mathsf{total}$  variable.

#### 0.3 Table

The data on exponential growth can be found in the table below.

| time | count     |
|------|-----------|
| 60   | 10000     |
| 90   | 25587     |
| 120  | 76327     |
| 150  | 212715    |
| 180  | 619511    |
| 210  | 1940838   |
| 240  | 4240760   |
| 270  | 13993730  |
| 300  | 38971086  |
| 330  | 105614040 |

## 0.4 Figure

See figure 1 for an illustration that explains the python dictionary concept.

### 0.5 Math

Now we add some mathematical formula:

$$K_n = rwTK_{n-1} \left(1 - \frac{K_{n-1}}{H}\right) - K_{n-1}.$$

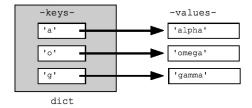

Figure 1: Data structure concept of a dictionary in python. From [?].
